

Migrating from an old integration.

If you have previously integrated our SDK as a raw binary with header files and want to begin integrating our SDK as a first-class framework.

1. Remove the *libAppLovinSdk.a* file and all relevant header files from your project.
2. Drag the *AppLovinSDK.framework* file into your project directory (i.e. “Frameworks” folder). Make sure to check “Copy items if needed”.
3. Remove all import statements for our SDK. (i.e. `#import "ALSdk.h"`)
4. Replace removed import statements with either

```
#import <AppLovinSDK/AppLovinSDK.h>
```

or if you’re using modules,

```
@import AppLovinSDK;
```

5. Build and run! Make sure to check out our docs (<https://www.applovin.com/integration#iosIntegration>) and demo apps (<https://github.com/AppLovin/AppLovin-iOS-SDK-Demo>) for more detailed integration instructions and examples.
